VoiceKirana

An Indian Multilingual AI Shopping Assistant

Project repository: github.com/123saianu/VoiceKirana | **Live application:** voicekirana-web.onrender.com

The problem

Conventional online grocery shopping often assumes that customers are comfortable typing product names and quantities in English. This can make product discovery and ordering less convenient for people who prefer speaking in their regional language. Local shops also need a clear way to manage incoming orders and stock.

Our solution

VoiceKirana is a voice-first, multilingual grocery shopping assistant designed for Indian users. Customers can express grocery requirements naturally, including in Telugu, and the application converts those requests into structured items that can be reviewed, checked against shop inventory, and submitted as an order.

What it can do

- Multilingual voice interaction using Gnani AI speech technologies.
- AI-powered extraction of product names, quantities, units, brands, and variants.
- Product catalogue, search, cart management, and quantity updates.
- Inventory validation before order confirmation.
- Shop-side order acceptance or rejection, with order history and status tracking.
- Razorpay payment integration, verified using test-mode transactions.

How it is built

The application uses Python, FastAPI, and Streamlit, with SQLite/PostgreSQL for data storage. Gnani AI Prisma provides speech-to-text and text-to-speech capabilities, while Gemini AI supports structured understanding of grocery requests. Razorpay is integrated for online payments, and the application is deployed on Render.

Why it matters

VoiceKirana aims to make digital grocery shopping more natural and accessible by reducing reliance on English typing and connecting customers with local shops through a structured ordering workflow. Its longer-term vision is to make ordering everyday essentials as simple as speaking in one's own language.

Project focus: Multilingual AI • Voice-first UX • Grocery intelligence • Local-shop ordering
